

# Algorithms and Sorting

Course: CPSC 1150  
Instructor: Dr. Bitá Shadgar

Lecture 22

# Learning Outcomes

- Define and apply algorithm for sorting a list

# Sorting an array

## Example

Sort an array of numbers (called myList) in ascending order

- Problems in this form show up everywhere in computer science
- Often its not numbers, but other comparable objects (anything that can be ordered)
- Sometimes its descending order instead
- No matter the details, the same algorithms can be used with many different types of data, in a variety of applications
- **Question:** If you had to sort something manually (assignments by last name, books by title, pens by color) how would you do it?

# Some sorting algorithms

There are many different sorting algorithms out there

- Bubble sort
  - Swaps neighboring elements until everything is in order
- Selection sort
  - Selects min element and swaps with current element
- Insertion sort
  - Takes the next element and inserts into the sorted portion
- Merge sort
  - Sort chunks of the list and merge the chunks
- Quick sort
  - Organizes elements based on pivot values And more. . .
- To see some very neat visualizations of these algorithms, and learn more, check out:
  - <http://www.sorting-algorithms.com/>
  - <https://visualgo.net/en/sorting>

# Selection Sort

- For an array with  $n$  elements, the idea is as follows:
  1. Find the minimum element in the list and swap it with the first
  2. Find the minimum element among the remaining  $n - 1$  elements, and swap it with the second
  3. Find the minimum element among the remaining  $n - 2$  elements, and swap it with the third
  4. etc.
- One of the simplest sorting algorithms
- Performs very many comparisons but very few swaps

# Selection Sort

23	78	45	8	32	56	Original List
8	78	45	23	32	56	After pass 1
8	23	45	78	32	56	After pass 2
8	23	32	78	45	56	After pass 3
8	23	32	45	78	56	After pass 4
8	23	32	45	56	78	After pass 5

Sorted

Unsorted

# Pseudo-code : Selection sort

## Selection Sort

1. START
2. Set  $i = 0$
3. WHILE  $i < n - 1$ , REPEAT:
  - 3.1 Set  $j$  = the index of the minimum element in  $\{L_i, \dots, L_{n-1}\}$
  - 3.2 IF  $j \neq i$ :
    - 3.2.1 Swap positions  $j$  and  $i$  in  $L$
  - 3.3 Increment  $i$  by 1
4. END

## Swap

1. START
2. Set  $\text{temp} = K_i$
3. Set  $K_i = K_j$
4. Set  $K_j = \text{temp}$
5. END

## Finding index of the minimum

1. START
2. Set  $\text{min} = i$
3. WHILE  $i < n$ , REPEAT:
  - 4.1 IF  $K_i < K_{\text{min}}$ :
    - 4.1.1 Set  $\text{min} = i$
  - 4.2 Increment  $i$  by 1
5. Output  $\text{min}$
6. END

# Bubble Sort

- Bubble sort uses the same selection sort approach:
  - Find the min/max item
  - Put it into its proper place
- But a different scheme is applied for finding the min/max item:
  - Starting with the last (first) item, compare successive pairs of items, swapping whenever the bottom item is smaller than the one above it

# Bubble Sort

23	78	45	8	32	56
----	----	----	---	----	----

Original List

8	23	78	45	32	56
---	----	----	----	----	----

After pass 1

8	23	32	78	45	56
---	----	----	----	----	----

After pass 2

8	23	32	45	78	56
---	----	----	----	----	----

After pass 3

8	23	32	45	56	78
---	----	----	----	----	----

After pass 4

8	23	32	45	56	78
---	----	----	----	----	----

After pass 5

# Pseudo-code : Bubble sort

## Bubble Sort

1. START
2. Set  $i = 1$
3. WHILE  $i < n$ , REPEAT:
  - 3.1. for  $j$  from  $n-1$  to  $i$ 
    - 3.1.1. if  $a[j - 1] > a[j]$ 
      - 3.1.1.1. **swap**( $a[j]$ ,  $a[j - 1]$ )
  - 3.2. Increment  $i$  by 1
4. END

## Swap

1. START
2. Set  $temp = K_i$
3. Set  $K_i = K_j$
4. Set  $K_j = temp$
5. END

# Bubble Sort – How to improve it?

23	78	45	8	32	56
